

THE NEW FALCON: EVEN MORE MOBILE

Over a decade on from its launch, **Ferdinand Gross'** FALCON kanban solution has been enhanced in term of performance and design. There's also a completely redesigned mobile app putting FALCON benefits in the hands of even more users...

Ferdinand Gross introduced the groundbreaking E-Kanban solution, FALCON, which has received multiple awards and has become indispensable for many in modern C-parts management. Now, the company presents a revamped version that makes the tool even more mobile, attracting new user groups.

With the web-based FALCON software, users can determine the exact location of each C-part in a matter of seconds, track the annual procurement volume of individual screws with just a few clicks, and even manage the entire kanban system from the comfort of their home office. Originally designed for purchasing departments, FALCON has now also established itself in other departments.

"Our customers quickly realised that the information provided in FALCON can be of interest to many," says Ralph Wittum, Sales Director at Ferdinand Gross. Quality assurance departments, for example, appreciate the document management feature for easily viewing and downloading inspection certificates and certificates for all C-parts. In development departments, managed manufacturing drawings are increasingly used.

FALCON is in use by over 90% of Ferdinand Gross's kanban customers. The new version aims to further expand this success and convince additional user groups of the E-Kanban solution.

The new version offers a fresh design, improved performance and user guidance, extended search filters and evaluations, as well as export options to Excel. Particularly noteworthy is the completely redesigned mobile app for iOS and Android. It offers nearly all the features of the desktop version and enables convenient usage on the go.

Employees in production, who previously had limited access to FALCON, benefit significantly from the app. With a simple

touch, they gain a quick overview of the installed kanban shelves. Outsiders, such as temporary workers or new employees, can find their way around more quickly and save valuable time. Additionally, restructurings and re-sortings of articles can be easily recorded in the program and are immediately visible and comprehensible to everyone.

The new generation of the FALCON tool is ready to make the C-parts management of the future even more digital and efficient. Customers like Norbert Rohr, Kanban Manager at UNSINN, are already looking forward to the update: "FALCON is in daily use with us. With the new mobile app, the tool will be used even more comprehensively by employees from various departments and from anywhere."
